

2. Every page must output the correct page-specific initial HTML before hydration, including:

- the exact approved SEO title for that page
- the exact approved meta description for that page
- the correct self-referencing canonical for that page
- the correct page-specific OG tags
- the correct page-specific H1 and body content

3. Canonicals must use our preferred final URL format consistently. Use the non-www version for all pages.

4. Remove any broken or duplicated template/head output that is causing inconsistent source behavior across routes.

- 5. Do not use generic defaults, homepage defaults, or fallback metadata on any priority page.

By morning, I need one message back with:

- the exact list of URLs fixed
- confirmation that the initial HTML is now correct before JS
- proof from your side for each fixed page showing the raw source output for:
 - title
 - meta description
 - canonical
 - OG tags
 - correct H1/body content

Please do not respond with “it looks correct in the browser” or “the SEO title appears after load.” The issue is the initial HTML output, and that is what needs to be corrected and verified.

Also, the title tag and meta description for each page should match the exact SEO versions already provided and approved for that page, not rewritten defaults.

This must be fully cleaned up tonight.
